

IE System Overview/ Business Vision -

An idea about risks for your systems overview (but do some research)

There may be no risks at this time, but say so !

These are not risks

User wanting changes (that is an expectation of this approach)

Not knowing technology (But of course, and to be expected and to be managed.)

Not communicating requirements properly (this is an issue you have to resolve, you have to find the best approaches to communicating e.g. models, mock ups and so on)

The system might not be tested in all aspects. (It should be!)

In this project, the schedule for each phase is very crucial and a slip in the schedule may happen. (This is meaningless)

The schedule is based on the current requirements document. So any changes to the requirements could affect the schedule. (But of course, and to be expected and to be managed.)

There may be some unexpected issues (e.g. illness, accidents, absence, etc.) happen to the team members (of course, needs to be managed)

These might be risks (but only risks if you know they are going to or likely to happen)

Might be able to be resolved/mitigated by training so if you have them, you need to plan for training.

1. Lack of knowledge of technology that the client is using,

e.g. This is for clients who are using something like Shopify and you will have to integrate with it.

(It's not about learning new technology that you haven't used before to develop in, this is an expected part of this unit).

2. Lack of knowledge of different browser that the application might be run in

These are risks (but only risks if you know they are going to or likely to happen)

1. inter-department use

Need to plan for meetings with different departments

1. There may be delays caused by the need to resolve on the interpretation of key business rules across departments

2. The hosting services will not be purchased

Need to plan for this or find a way around

3. Hardware and software for the development environment will not be installed and ready for use when required. Need to plan for this or find a way around

4. Knowing that the client will be unavailable

for acceptance testing or for feedback

(r.g, client going away for a week or more)

The client will be away for three weeks
