

FIT3003 final Notes

Business Intelligence And Data Warehousing (Monash University)

L1: Understanding BI and DW

Why study BI & DW?

- Broadly, two categories of information systems in enterprise IT
 1. **Transaction processing systems:** System for collecting and recording information about business activities (*payroll systems, inventory management systems*)
 2. **Decision support system:** Systems for collating and analysing information (typically collected from transaction processing systems) to support organisational decision-making
- Approaches that work well for developing transaction processing systems often don't work for decision support systems.

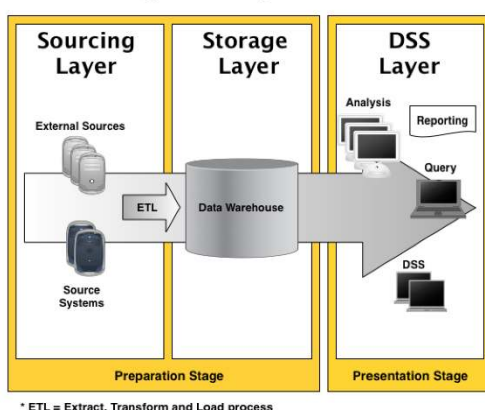

What is Business Intelligence?

- Designed to support informed decision making in organisation through provision of functions to visualise reports and analyse organisational data
 - o Huge amounts of data

What BI interfaces have in common:

- Data from lots of different sources → *Internal, external, different database management approaches, structured and unstructured data*
- Dashboards providing overview and monitoring of performance
- Ability to navigate from one report to another for investigation → 'Slice and Dice' and 'Drill Down'
- Visualisation of data → Graphical and Textual
- **BI Systems have to:** 1. Acquire data 2. Present it
- **Data warehouse** – Large, centralised database for storing data from transaction processing systems
 - o Provides data storage layer that provides: “**Subject-oriented, integrated, time-variant, non-volatile** collection of data in **support of management's decisions.**”

Business Intelligence System Architecture

Business Intelligence System Architecture

Why Data Warehousing?

- Data warehouses store data from transaction processing systems

Motivation for data warehousing:

- Data in source systems is frequently inconsistent, of poor quality and stored in different formats
- Query processing on transaction-processing systems is not a good option
- DW is custom-designed for efficient data retrieval
- DW reduces complexity and costs
 - o BI systems can source their data from single system with a known, consistent data structure and format

DW – subject oriented:

- Data warehouse is organised by “data subjects” that are relevant to organisation (Customer, claim, shipment, product)
- May be contrasted with the *process orientation* of many transaction-processing systems

DW – integrated:

- Data in the warehouse is structured based on a corporate-wide model, spanning the functional boundaries of source systems (the naming standards, units of measurement and periodicity)
- Compare with transaction processing system:
 - o Highly normalised
 - o Lack of consistency between systems

DW – time variant:

- Data in the data warehouse is characterised by the time-series nature of historical data
- Data consists of **series** of “snapshots” which are time-stamped and record values at a moment in time
- This *supports trend analysis* of data

DW – non-volatile:

- Data in a data warehouse is periodically up-loaded at a scheduled time interval (say daily) – “upserting”
- When updated → earlier versions of data is maintained
- Data warehouse is **not** continuously updated (inserts, deletes, changes) like data in transaction-processing systems (don’t maintain history – edits, deletions overwrite data)

Why learn about BI/DW? Key aspects of BI/DW systems make them different to other information systems: **The task** supported, **The users**, The **development process** required

The Task – Decision Making

- Task is typically well-defined business workflow:
 - o Clear responsibilities
 - o Explicit information requirements
 - o Explicit rules for using information to perform and action
- This allows us to develop a requirements specification for that information system design
- BI systems deal with a much more complex (design too) and ambiguously defined task than most transaction processing systems.

The Users

- Organisational decision makers: Knowledge workers, managers, executives, directors
- Impossible to specify what the above people do from moment to moment (Sales clerk: repetitive task vs. Manager: many different and unique one-off tasks)
- Organisationally powerful: If they don't want to use the BI system, they won't

The Development Process

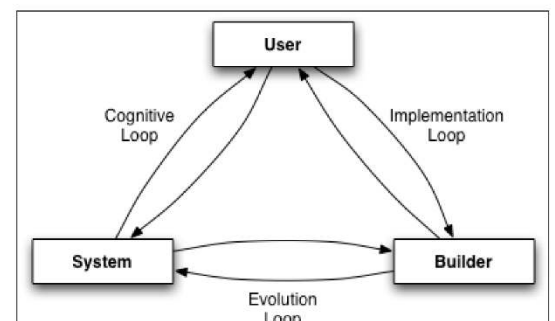

- Traditional approach to Software Development Life Cycle:
 1. Gather information requirements
 2. Produce a requirements specification document, with sign-off from client
 3. Develop the system – Database, software, hardware
 4. Test the system to make sure the system matches the requirements specification
 5. Client signs-off and takes acceptance of the system
 6. Project is closed

But for BI/DW:

- Purpose of the system is to help users understand the decision problem so they can make a better decision
- Information needed to make a good decision depends on the decision problem
- **Catch 22:**
You don't know what information you'll need until you start using the system → You can't use system until it's designed → Can't be designed until designer has gathered the information requirements

Decision Support Systems Development

- Framework for any system that supports decision-making:

BI/DW Development:

- Any system designed to support decision making must:
 - o Be closely developed with co-operation between users and developers

- *Developed in adaptive manner* – User understanding and requirements change? System design has too as well
- Evolutionary/Adaptive development
 - Significantly different to traditional project-based development where there is clear end-date and specific deliverable (and budget)
- High profile projects
 - Significant organisational impact, affects multiple business areas
- As a result → High risk

Summary:

- BI is current approach to organisational decision support
- DW provides data infrastructure to develop various decision support and business intelligence initiatives in an organisation
- BI/DW are fundamentally different from more typical information systems:
 - Different nature of *task support*
 - Different, discretionary and powerful *users*
 - Different, 'chaotic' *development process*

L2: BI Interfaces 1

Why is the BI user interface important:

- BI system developers care more about the technology, BI system users care most about the interface

General BI UI Requirements:

- Interface **must not get in the way**
 - o Allow “analysis at speed of thought” and “transparent interaction”
- Information presented must be **easy to understand**
- Must be **clear where information comes from**
- Interface must be **easy to learn** and **easy to remember**
- **Focus must be on the design** rather than engineering

Mobile BI UI Requirements:

- **General BI UI requirements still apply**
- Mobile BI applications **tend to support very specific tasks**
 - o Understand decision task and environment very well
 - o Work closely with users to develop the application
 - o Don't limit development and testing to emulators
- Design BI application interface to **conform with UI conventions** of the target platform
- Choose **font sizes and menu targets** carefully
- Mobile application users **expect “beautiful” apps**

Business Intelligence UI Components:

Report -

- **Document that presents information in an organised format for a specific audience and purpose**
- Information organised in → Graphic, tabular, narrative formats
- **Reports output:** Generated on recurring schedule, when certain conditions met or as required
- Can be *static or interactive* (**users can enter parameters, sort columns, filter content**)

Tables -

- **Values are arranged in grid format** (rows, columns)
- Values are *encoded in text* (**words, numbers**)
- Rows and columns can be defined by grid lines or white space
- **Most appropriate method to:**
 - o Display information when user has need to look up individual values
 - o Display simple relationship between numeric and categorical values

Graphs (Charts) –

- Values are displayed within an area bordered by 1/+ axes
- Values are *encoded as visual objects* (shapes and lines) positioned in relation to the axes
- Axes provide scales that are used to label and assign values to the visual objects
- **Most appropriate method when:**
 - o Message is contained in shape of the values
 - o Objective is used to reveal relationships among multiple values

Dashboards –

- Visual display of the most important information needed to achieve one or more objectives which fits entirely on a single computer screen so it can be monitored at a glance
- Small, concise, clear, intuitive, and **often interactive** display
- Customised for specific person, group, or function
- Focus → Monitoring and measuring
- Consists of → Charts and tables
- **Types:**
 - o **Strategic**
 - Used by managers to monitor business health & progress towards meeting strategic objectives
 - High-level measure of past and forecast performances (last week/month)
 - o **Analytic**
 - Used by analysts as a way to gain access to broad range of more detailed information → Find out why things happen
 - o **Operation**
 - Used to *monitor operation of a factory or service*
 - Display of information is real-time or near-real-time (NOW)
 - Displays measures, warnings, alerts
- **Purpose:** Let end-users understand their business intuitively without too much thinking, meaning they can receive critical information from dashboard without even interacting with it.

Dashboard vs Report

- Minimal interactivity and analysis needed
- Requires minimal cognitive effort
- Focus on quick communication of key data
- **Individual visualisations should work together to communicate effectively:**
 - o Consider placement for comparisons
 - o Avoid multiple 'screens' (tabs – horizontal, scrolling – vertical). No navigation.
- Click through to reports for substantial analysis
- Dashboards provide summary while reports let you detailed analysis

BI UI Navigation Methods:

Drill-Down

Navigation to a report with **more detail** following the levels of a pre-defined dimension hierarchy.

– Example

- Yearly sales
- Quarterly sales
- Monthly sales
- Daily sales

Camp Performance
Examine invoicing figures by Camp Location hierarchy.

Camp Region	KPI	Invoiced
Asia	✓	\$120,474,325
Australia	✓	\$97,832,651
Europe	✓	\$191,551,494
Latin America	✓	\$1,602,199
North America	✓	\$59,474,870
		\$470,943,846

Reset Report

Camp Performance
Examine invoicing figures by Camp Location hierarchy.

Camp Region	KPI	Invoiced
North America	✓	\$59,474,870
		\$59,474,870

Reset Report

Camp Performance
Examine invoicing figures by Camp Location hierarchy.

Start > Camp Region: North America > Camp Country: Canada

Camp Name	KPI	Invoiced
Camp Fortune	✗	\$195,334
Georgian Peaks	✓	\$7,381,135
Grossmont St. Jean	✗	\$169,705
Gurgl	✗	\$14,035
Happo-one Haruba	✗	\$415,154
Hoodfoot	✗	\$79,681
Jean Forest Resort	✓	\$301,832
Mont Orford	✓	\$9,155,999
Nanica	✗	\$97,517
Quebec City	✗	\$49,299
Sun Peaks	✗	\$73,001
		\$17,935,402

Drill-down navigation is often available on BI charts and maps

Drill-Through

Navigating from a summary report to report that shows the **detailed transaction** that made up the summary.

– Example

- Yearly sales
- Quarterly sales
- Monthly sales
- Daily sales

Camp Performance
Examine invoicing figures by Camp Location hierarchy.

Camp Region	KPI	Invoiced
North America	✓	\$59,474,870
		\$59,474,870

Reset Report
Camp Performance

			\$31,567	\$0	\$27,264
			\$31,567	\$0	\$27,264

Drill-Across

Navigation from a report based on one set of dimension attributes and measure(s) to a new report with the same set of dimension attributes but with **different measure(s)**.

Total Invoiced by Region and Gender

Invoiced Amount	Gender		
Camp Region	Female	Male	Total
Asia	\$49,322,356	\$71,151,969	\$120,474,325
Australia	\$21,913,736	\$75,919,915	\$97,832,651
Europe	\$58,751,572	\$132,799,922	\$191,551,494
Latin America	\$506,173	\$1,096,026	\$1,602,199
North America	\$19,829,976	\$39,645,895	\$59,474,870
Total	\$150,322,813	\$320,612,526	\$470,935,339

Cost of Camp by Region and Gender

Cost of Camp	Gender		
Camp Region	Female	Male	Total
Asia	\$3,236,357	\$2,641,974	\$5,878,331
Australia	\$3,290,812	\$2,582,820	\$5,873,632
Europe	\$5,509,377	\$8,360,785	\$13,870,161
Latin America	\$314,781	\$681,962	\$996,744
North America	\$2,094,308	\$2,967,848	\$5,062,156
Total	\$14,453,635	\$17,235,688	\$31,689,324

Designing the BI UI:

- Usability

- “Extent to which a product can be used by specified users to achieved specified goals with **effectiveness, efficiency and satisfaction** in a specified context of use”

- **Affordance**
 - o A capability, offered by an artefact, to a user. Can be different for different users.
 - o What the object means to you/Use of the object ("To sit on")
- **Visibility**
 - o Features or properties of an object that tells or shows a user how to interact with, or the status of, an object ("Button → Push", "Switch → Flip")

UI Design Guidelines:

1. **Visibility of System Status** → System gives you feedback on what's going on (Progress bar, error message, "Loading", Spinning wheel)
2. **Match Between System and Real-World** → System should use language (words, phrases) that are familiar to user
3. **User Control and Freedom** → Support undo and redo where user could make "emergency exit" if needed
4. **Consistency and Standard** → User shouldn't have to worry if different words/actions mean the same thing
5. **Error Prevention** → Eliminate error-prone conditions or check for them and present users with confirmation option before committing to action
6. **Recognition Rather than Recall** → Interface should be easy to recognise what it's about (Easily understandable in second)
7. **Flexibility and Efficiency of Use** → Allows users, whether inexperienced/experienced to tailor frequent actions
8. **Aesthetic and Minimalist Design** → Dialogue shouldn't contain info which is irrelevant or rarely needed
9. **Help users Recognise and Recover from Errors** → Error messages should be expressed in plain languages (no codes), precisely indicate the problem and continuously suggest solution
10. **Help and Documentation** → Better if system can be used without documentation but may be necessary to provide help/documentation

Usability Testing:

- **What is it?** → Test the application
- **Why do it?** → To make sure you're on the right track
- **When should it be done?** → Draft application ready

Usability Testing - Structure:

- **Identify the scope** → The thing(s) you actually test
- **What is the purpose** → To see if it's easy to understand/use
- **Schedule and location** → Define where you run it

- **Who will participate** → Define target audience
- **How many participants?**
- **Choose scenarios**
- **Identify test metrics** → # of steps/clicks to do task, time used (too much = not good)
- **Conduct the test**
- **Compile the results**
- **Fix the usability problems**

Summary:

- BI UI consists of → *Reports, tables, graphs and dashboards* and can be *navigated* in different ways
- Usable BI UI → *Satisfied users & confident in information* provided
- Apply *usability principles* and conduct *usability test*

L3: BI Interfaces 2

Financial Markets and Financial Intermediaries:

- **Security** - A claim on the issuer's future income or assets
